# STATUS OF ELECTROSTATIC SEPARATORS AT KEK

# Harumi Ishii and Akira Yamamoto

National Laboraotory for High Energy Physics

Electrostatic separators with built-in high voltage generators were developed for the secondary beam lines of the 12 GeV proton synchrotron at KEK<sup>1</sup>). Thev have been operated stably since they had been installed in the beam lines. The maximum field of 1005 KV / 10 cm was achieved in the latest one (Mark II-2) whose aperture of the field of 10 cm<sub>g</sub> x 40 cm<sub>W</sub> x 6 m<sub>l</sub>. The performance of the electrostatic separator is given and the characteristics of vacuum breakdown in the region of  $10^{-4}$  Torr is also discussed.

## Performance

All of the separator have been operated in the beam lines at the electric field between 600 kV / 10 cm and 900 kV / 10 cm. The performance of the latest separator which is more compact than that of the initial type of the KEK separator (Mark I) is given in Table 1. The maximum field of theis separator was 1005~kV / 10 cm with the spark rate of 0.3 sparks / min.. The continuous opration has been performed at the field of 900 kV / 10 cm with the spark rate of 1 spark / h in the beam line. The pressure dependence of the breakdown voltage (P-V curve) is shown in Fig. 1. Helium and Neon (35%-65%) gas mixture is flowed to adjust the pressure. The continous operation is performed in the pressure range of a few times of 10 -4 Torr.

Characteristic of Vacuum Breakdown in This Region The breakdown voltage in the region of 10<sup>-5</sup> 10<sup>-4</sup> Torr depnds on the pressure of the residual gas. This effect has been studied by the authors et  $a1^2$ ).

Table 1, Performance of the electrostatic separator (Mark II-2).

| Electrode gap           | 10 cm                                     |
|-------------------------|---|
| width                   | 40 cm                                     |
| length                  | 6 m                                       |
| Electrode Material      |   |
| positive                | stainless steel                           |
| negative                | anodised aluminum                         |
| Maximum field           | 1005 kV / 10 cm                           |
| spark rate              | 0.3 / min                                 |
| Working field           | 900 kV / 10 cm                            |
| spark rate              | 1 / h                                     |
| Conditioning time       | a few days                                |
| Deconditioning rate and | 2 x 10 <sup>-6</sup> Torr /day            |
| Pressure plateau at     | 1 x 10 <sup>-3</sup> Torr                 |
| working field           | 900 kV / 10 cm                            |
| Support insulator       |   |
| dimension               | 10 cm (o.d.) x 20 cm                      |
| material                | ceramic (Al <sub>2</sub> 0 <sub>3</sub> ) |
| <b>H.V.</b> generators  | _   |
| dimensions ( x, y, z )  | 20 x 72 x 70 cm <sup>3</sup>              |
| maximum H.V.            | +600 kV                                   |
| stability               | 10-4                                      |

The following relationship between the maximum voltage (V) and the pressure (p) was found by our experiments,

 $V = V_0 + kp$ 

where  $V_0$  is the maximum voltage at the ultra low pressure ( $10^{-6}$ ) and k is a coefficient. Figure 2 shows the pressure dependence of the maximum voltage for the various gases at the separator Mark III with the gap of 15 cm and the length of 2 m. The k is the function of the gas material. In fig. 3 , the maximum voltages are plotted as the function of the atomic mass number at the pressure of 1 x  $10^{-4}$  Torr. It seems to be understood as the nearly linear function in this mass region for the innert gases.

The useful gas for the electrostatic separator should not be chosen by only the above relationship but by also the the effect of the critical pressure where gaseous discharge is initiated. The effect of the critical pressure is discribed elsewhere.

Neon and helium gas mixture was chosen as the optimised gas for the KEK separators.

## Summary

The electrostatic separators with built-in high voltage generators have been operated staby in the beam lines and the no problem have happened during these two years. The working field of 900 kV / 10 cm is a satisfactory result in this development.
